UMISO7720 SOP8/WSOP8/WSOP16
UMISO7721 SOP8/WSOP8/WSOP16
UMISO7723 SOP8/WSOP8/WSOP16

1 描述

UMISO772x 系列均为高性能双通道单向数字隔离器，提供 $3.75\text{kV}_{\text{RMS}}$ （窄体封装）和 5kV_{RMS} （宽体封装）两种隔离等级，支持 DC 至 150Mbps 数据传输速率。该器件以具备低功耗的特点，同时展现出优异的电磁抗扰性和低辐射特性，可有效隔离不同接地域，并阻断高压/大电流瞬态干扰对敏感电路或人机接口电路的影响。各隔离通道均由逻辑输入与输出缓冲器构成，并通过二氧化硅（SiO₂）电容绝缘屏障实现电气隔离。每个输入端集成的施密特触发器在汽车应用中可提供卓越的抗噪性能。

UMISO7720 系列两通道都为正向传输。UMISO7721 和 UMISO7723 系列具有一路正向和一路反向通道，以适配隔离式 CAN、RS-485 等通信场景。这些器件具备默认输出特性。当电源未上电或处于开路状态时，后缀为 L 的型号默认输出低电平，后缀为 H 的型号默认输出高电平。具体型号后缀与选项的对应关系详见订购信息表。

UMISO772x 系列采用 SOP8 窄体封装、WSOP8 宽体封装和 WSOP16 宽体封装，其工作环境温度范围为 $-40\text{ }^{\circ}\text{C}$ 至 $125\text{ }^{\circ}\text{C}$ 。

8 Parameter Measurement Information

Note 1: A square wave generator provides V_{IN} input signal with characteristics: frequency $\leq 100\text{kHz}$, 50% duty cycle, $t_R \leq 3\text{ns}$, $t_F \leq 3\text{ns}$, $Z_{OUT} = 50\Omega$. At the input, 50Ω resistor is required to terminate input generator signal. It is not needed in actual application.

Note 2: $C_L = 15\text{pF}$ and includes external circuit (instrumentation and fixture etc.) capacitance. Since the load capacitance influence the output rising time, it's a key factor in the timing characteristic measurement.

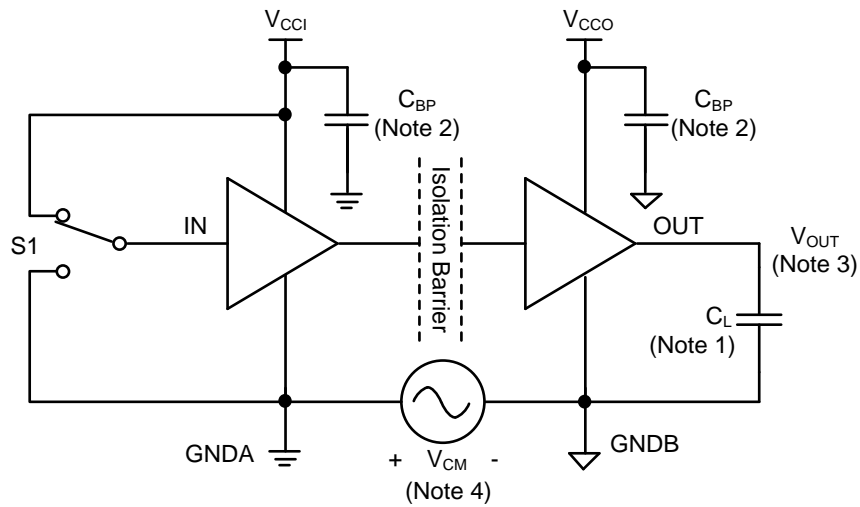

Figure 8-1. Switching Characteristics Test Circuit and Voltage Waveforms

Note 1: Power Supply Ramp Rate = 10mV/ns . V_{CCI} should ramp over 2.375V , and less than 5.5V .

Note 2: $C_L = 15\text{pF}$ and includes external circuit (instrumentation and fixture etc.) capacitance. Since the load capacitance influence the output rising time, it's a key factor in the timing characteristic measurement.

Note 2: C_{BP} (0.1 ~ 1 μF) is bypass capacitance.

Note 3: Pass-fail criteria: the output must remain stable.

Note 4: The High Voltage Surge Generator generates repetitive high voltage surges with >1kV amplitude, rise time <10ns and fall time <10ns, to reach common-mode transient noise with >150kV/ μs slew rate.

9 Detailed Description

9.1 Overview

The UMISO772x devices are a family of automotive, 2-channel digital galvanic isolators using Union’s full differential capacitive isolation technology. These devices have an ON-OFF keying (OOK) modulation scheme to transfer digital signals across the SiO₂ based isolation barrier between circuits with different power domains. The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal and recovers input signal at output through a buffer stage. With this OOK architecture, UMISO772x devices build a robust data transmission path between different power domains, without any special start-up initialization requirement.

These devices also incorporate advanced full differential techniques to maximize the CMTI performance and minimize the radiated emissions due the high frequency carrier and I/O buffer switching.

9.2 Functional Block Diagram

Figure 9-2. Conceptual Operation Waveforms of a Single Channel

9.3 Device Operation Modes (Note 1, 2, 3)

Table 9-1 lists the operation modes for the UMISO772x devices.

Table 9-1. Operation Mode Table (Note 1, 2)

V _{CCI}	V _{CCO}	Input (IN _x)	Output (OUT _x)	Operation
X	PD	X	Undetermined	If the output side V _{CCO} is unpowered, a channel output is undetermined. (Note 3)
X	PU	X	Z	High impedance mode: A low level of Enable pin causes the output to be high impedance.
PD	PU	X	Default	Default output mode: When V _{CCI} is unpowered, a channel output assumes the logic state based on its default option. Default is High for UMISO772xH and Low for UMISO772xL .
PU	PU	H	H	Normal operation mode: A channel output follows the logic state of its input.
		L	L	
		Open	Default	Default output mode: When input is open, the corresponding channel output goes to its default logic state. Default is High for UMISO772xH and Low for UMISO772xL .

Note 1: V_{CCI} = Input-side V_{CC}; V_{CCO} = Output-side V_{CC}; PU = Powered up (V_{CC} ≥ V_{CC(UVLO+)}); PD = Powered down (V_{CC} ≤ V_{CC(UVLO-)}); X = Irrelevant; H = High level; L = Low level; Z = High Impedance.

Note 2: A strongly driven input signal can weakly power the floating V_{CC} through an internal protection diode and cause undetermined output.

Note 3: The outputs are in undetermined state when V_{CC(UVLO+)} < V_{CCI}, V_{CCO} < V_{CC(UVLO-)}.

10 Application and Implementation

10.1 Application Information

The UMISO772x isolation ICs provide complete galvanic isolation between two power domains, protecting circuits from high common-mode transients and faults, and eliminating ground loops. In many applications, digital isolators are replacing optocouplers because they can reduce the power requirements and take up less board space while offering the same isolation capability. The UMISO772x devices are the high-performance, 2-channel digital isolators. Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the UMISO772x devices only require two external bypass capacitors to operate. To reduce ripple and the chance of introducing data errors, bypass V_{CCA} and V_{CCB} pins with $0.1\mu\text{F}$ to $1\mu\text{F}$ low-ESR ceramic capacitors to GNDA and GNDB respectively. Place the bypass capacitors as close to the power supply input pins as possible.
